

a2

possible to avoid recording errors or failure stemming from an inadvertent mistake, such as a user forgetting to program the recording operation prior to the start of a broadcast.

Page 1, replace the last paragraph bridging page 2 with the following new paragraph:

It is, however, possible for broadcast recording to fail, even if no mistakes have been made. For example, variations in the status of reception may lead to data being lost, thereby rendering the recording defective. A receiving apparatus equipped with a function also providing appropriate measures against this type of failure in recording is therefore desired. Presently, however, recording management relies on a user's own memory. If a recording has once failed, the user must remember to seek and record the same broadcast content later.

a3

Page 4, please replace the last full paragraph with the following new paragraph:

According to the present invention, when the attempted recording of broadcast content has failed, the incidental information is used as a basis for searching for an alternative broadcast content providing the same content. For example, a search is made for a rebroadcast of the program, the recording of which ended in failure. In another example, a search is made for another music broadcast, the recording of which ended in failure. Promotion of recording of such alternative broadcast content enables restoration of a failed recording.

Q5

Page 5, replace the first and second full paragraphs with the following new paragraphs:

According to a second aspect of the present invention there is provided a broadcast receiving apparatus comprising reception means receiving broadcast content and incidental information allowing identification of the broadcast content; record means recording the broadcast content received; and linkage processing means linking together, when recording of a broadcast content has ended in failure, broadcast content that is positioned immediately before and after the broadcast content, the recording of which has ended in failure, by use of the incidental information.

According to the present invention, two broadcast content is linked together that are positioned immediately anterior and posterior to a broadcast content, the recording of which has ended in failure. For example, upon the recording of a music program, data on a failingly recorded song are deleted and data on songs immediately before and after the failed song are linked together. By virtue of this, when reproducing the recorded broadcast content, reproduction is advantageously prevented from being interrupted midway through it.

[Page 5, replace the last paragraph bridging page 6 with the following new paragraph:]

Preferably, the broadcast receiving apparatus further comprises supplement means acquiring an alternative broadcast content providing the same broadcast content as the broadcast content, the recording of which has ended in failure, on the basis of the incidental information, the supplement means inserting the acquired alternative
